

Geophysical Instrumentation for Engineering and the Environment

GEONICS LIMITED is the world leader in the manufacture of electromagnetic geophysical instrumentation.

Electromagnetic methods offer a non-intrusive means of subsurface site characterization. Rapid, high-resolution data acquisition facilitates production of low-cost, detailed maps which provide unsurpassed guidance for follow-up. Quality assurance in site characterization is also vastly enhanced.

Electromagnetic methods are routinely used for near-surface engineering and environmental applications, which include the mapping of:

- *groundwater contamination*
- *buried metallic hazards including underground storage tanks, drums, pipelines and unexploded ordnance*
- *buried waste; trench and landfill boundaries*
- *natural geologic features such as fractures, voids and sinkholes which control groundwater movement*
- *man-made structures; foundations and historical artifacts*

Since 1962, Geonics has supplied practical and reliable instruments to government agencies, private and non-profit organizations, and educational institutions in over 40 countries worldwide.
